For e-commerce dataset:

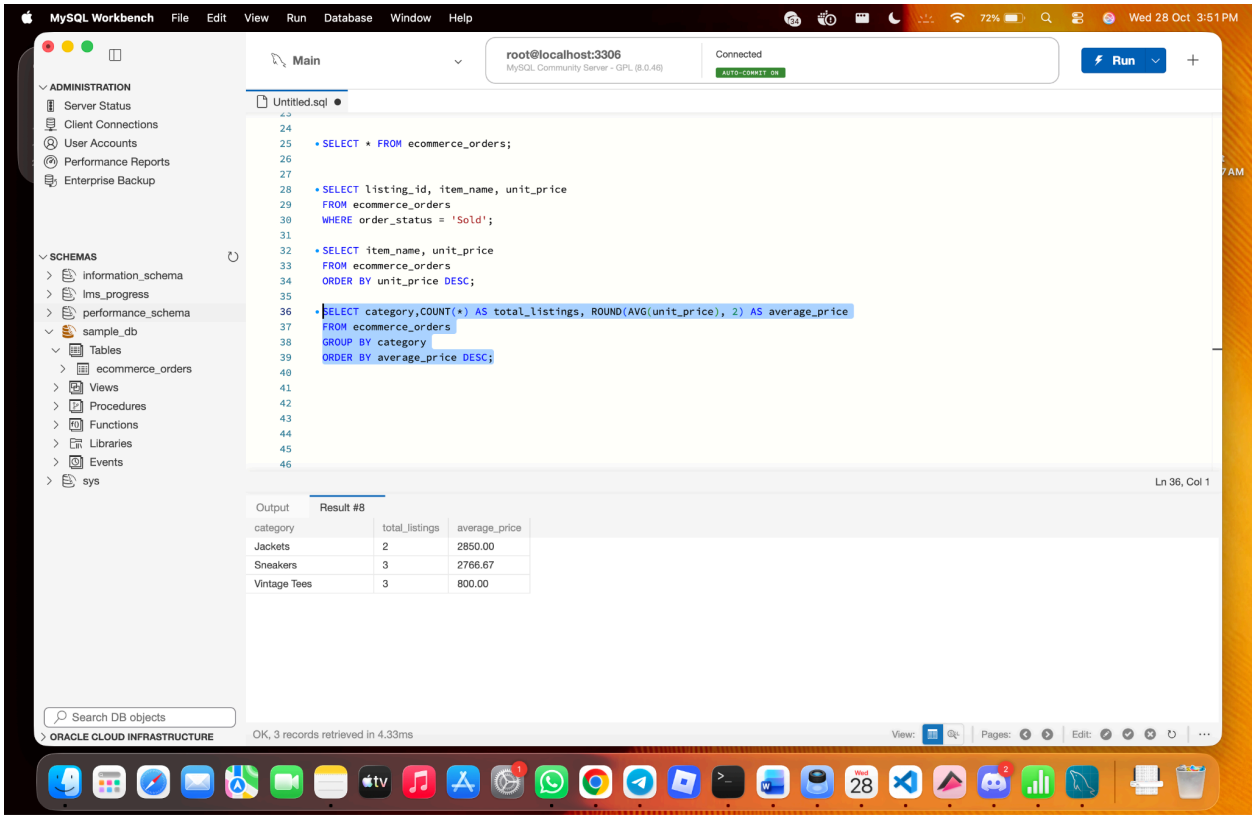

Select query command: to get all records from a particular table

Where clause is used to filter the result set based on specified condition

Order by clause is used to sort the query results based on a column or an attribute

Group by clause groups rows that have the same values into summary rows. Here it Counts how many records fall under each order status.

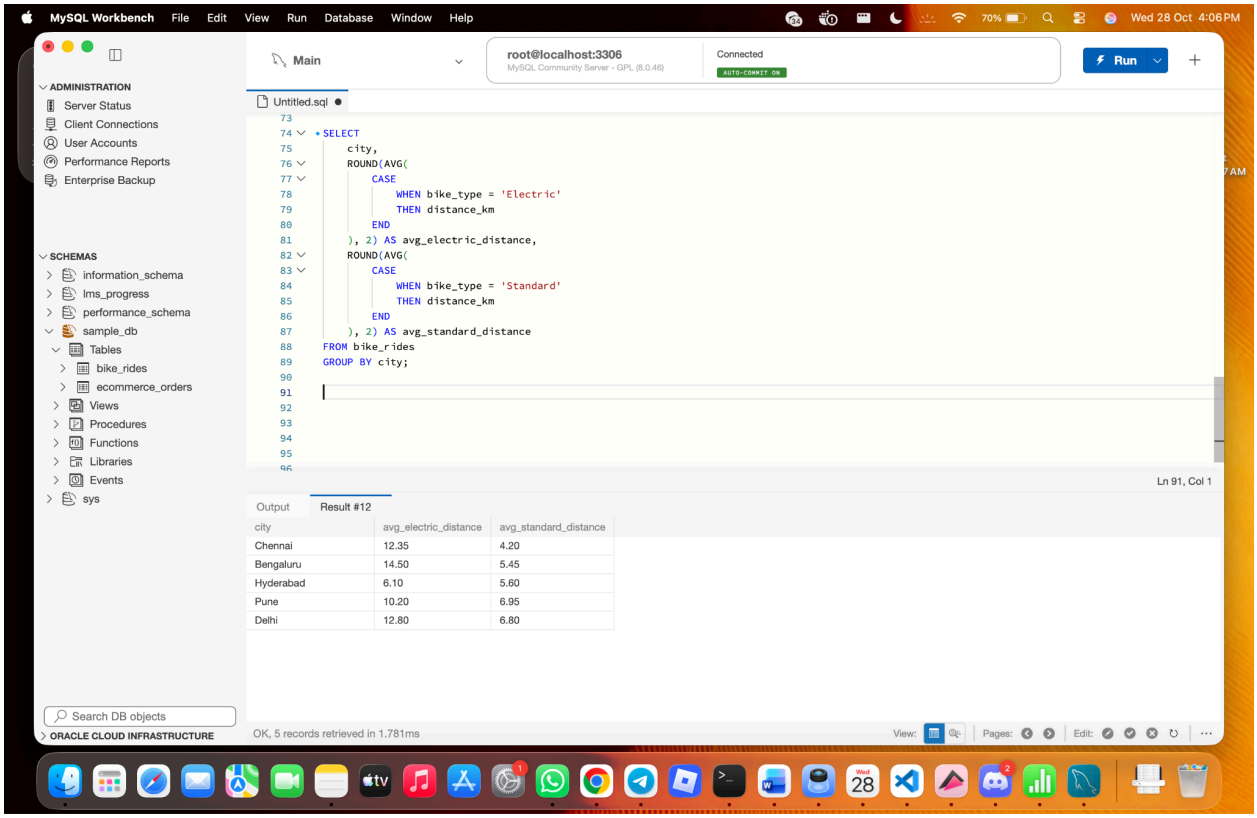

For bike_rides dataset:

```
69
70  SELECT ride_id, city, distance_km, ride_cost_inr
71  FROM bike_rides
72  WHERE distance_km IS NULL;
73
74
75
76
77
78
79
80
81
```

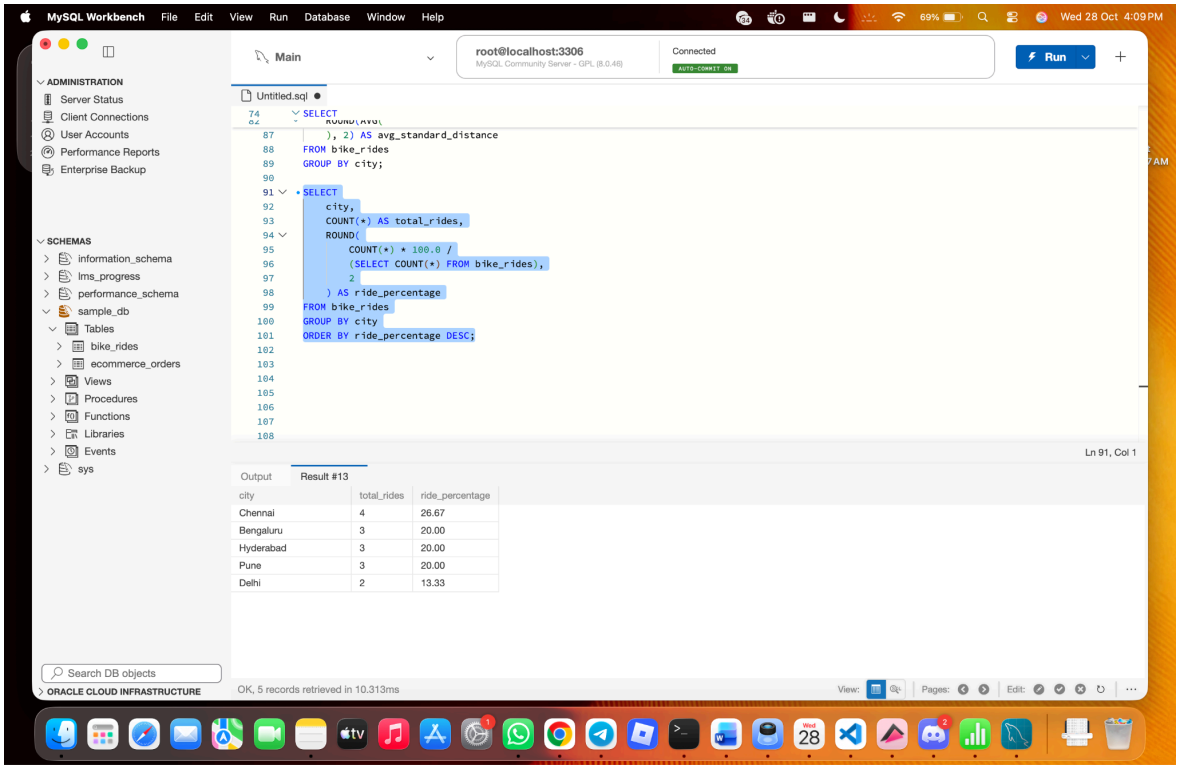

Output | Result #11

ride_id	city	distance_km	ride_cost_inr
R015	Chennai	NULL	35.00

IS NULL clause is used toIdentify missing values. Here it is finding out where distance is not filled in bike_rides

Compares the average distance travelled on electric and standard bikes in each city. CASE WHEN is used to write conditional statement.

Calculates the percentage of all ride records contributed by each city.
